

ANGULAR EDIT PROFILE LAB

Task: Create a user profile page and a form to edit user details.

What does the application do?

You'll have two components and a service:

1. One displays the user's profile
2. One has a form to edit the user's information

For the service, since BOTH components need that same data, you need to create profile service to pass it to and from the components.

Build Specifications:

1. Use one component for the profile page, and another component for the edit profile page.
2. Create a service named ProfileService. It has a user profile object with initial values for name, contact info, and bio. It has two methods...
 - a. getUserProfile returns the profile object.
 - b. setUserProfile replaces the profile object with a new one.
3. The profile picture shown in the design is hard-coded. It cannot be changed.

Bonus:

Allow the user to pick from a set of pre-defined avatar images for the profile picture.
